## Features

- Directly operated valves (pilot valves) for limiting system pressure
- Adjustable by means of the solenoid current, see Characteristic curve, Technical data and selected valve electronics
- Solenoid versions  $I_{\text{max}} = 0.8 \text{ A}$  or  $I_{\text{max}} = 2.5 \text{ A}$
- Pressure limitation to a safe level even with faulty electronics (solenoid current  $I > I_{\text{max}}$ )
- For subplate attachment, mounting hole configuration to ISO 4401-03-02-0-94  
Subplates as per catalog sheet RE 45053 (order separately)
- Plug-in connector to DIN 43650-AM2 included in scope of delivery
- External trigger electronics with ramps and valve calibration in the following versions/designs (order separately)
  - Plug, setpoint 0...+10 V or 4...20 mA, RE 30264
  - Module, setpoint 0...+10 V, RE 30222
  - Europe card, setpoint 0...+10 V, RE 30109

## Function, sectional diagram

### General

Type DBETX proportional pressure relief valves are remote-controlled (pilot) valves in conical seat design. They are used to limit system pressure.

The valves are actuated by means of a proportional solenoid.

The interior of the solenoid is connected to port T and is filled with pressure fluid.

With these valves, the system pressure that needs to be limited can be infinitely adjusted by the valve amplifier electronics in relation to the solenoid current, at an oil flow  $\leq 1$  l that is as close as possible to constant.

### Basic principle

To adjust the system pressure, a setpoint is set in the trigger electronics. Based on this setpoint, the electronics control the solenoid coil with regulated PWM (pulse-width-modulated) current. The proportional solenoid converts the current to a mechanical force, which acts on a main spring by means of the armature plunger. An "additional" spring between the cone and the seat contributes to stability and a minimal residual pressure. The spring force acting on the cone and the pressure in the valve seat balance one another at a constant oil flow (0.7...1 l/min). The " $p_{max}$ " pressure stage is determined by the cone and seating bore configuration.

### Pressure limitation for maximum safety

If a fault occurs in the electronics, so that the solenoid current ( $I_{max}$ ) would exceed its specified level in an uncontrolled manner, the pressure cannot rise above the level determined by the maximum spring force.
