Throttle check valve

Type Z2FS

Size 16
Component series 3X
Maximum operating pressure 350 bar [5076 psi]
Maximum flow 250 l/min [66 US gpm]

Features

- Sandwich plate valve
- Porting pattern to ISO 4401-07-07-0-05 and NFPA T3.5.1 R2-D07
- For limiting the flow in 2 actuator ports
- Adjustment element: Spindle with hexagon socket
- For meter-in or meter-out throttling

Function, section

Valves of type Z2FS are throttle check valves of sandwich plate design. They are used to limit the flow in one or two actuator ports.

Two throttle check valves, which are arranged symmetrically to each other, limit flows (through adjustable throttle spools) in one direction and allow free return flow in the opposite direction.

In the case of meter-in throttling the hydraulic fluid is fed through channel A1 via throttling point (1) to actuator A2. The throttle spool (2.1) can be axially adjusted by means of spindle (3), thus allowing throttling point (1) to be adjusted.

At the same time, the hydraulic fluid present in channel A1 gets via bore (4) to spool side (5). Together with the spring force, the applied pressure holds the throttle spool (2.1) in the throttling position.

The hydraulic fluid returning from actuator B2 shifts throttle spool (2.2). The valve then acts as check valve with free flow. Depending on the variant (“S” or “S2”) throttling can be effective in the inflow or outflow.

Flow limitation

To change the velocity of an actuator, the throttle check valve is to be installed between the directional valve and the sub-plate.

---

1) Suitable for NBR and FKM seals  
2) Suitable only for FKM seals  
3) The cleanliness classes specified for components must be adhered to in hydraulic systems. Effective filtration prevents malfunction and, at the same time, prolongs the service life of components.  
For the selection of filters, see data sheets RE 50070, RE 50076, RE 50081, RE 50086, RE 50087 and RE 50088.
